### Abstract

**Warning:** This is only a piece of lecture notes written by a careless scribe. So just **be careful with and tolerant of any possible typos or misunderstandings** when you read <sup>0.1</sup>. The scribe does not intend to make anyone to be driven by his stupidity! Also, the professor's explanation is extremely helpful as he discusses a lot about the interpretable ideas behind the dull scripts. So watch the lecture before reading this. If you have any suggestions (e.g. typos, typography, logistics), please do not hesitate contacting the scribe!

Without specifications, the notation use is as the following

- $\mathbb{R}, \mathbb{C}, \mathbb{Q}, \dots$ : real, complex, quadratic, and so on
- $\mathcal{R}$ : integrability
- $\mathbb{1}$ : characteristic function
- $s$ : simple function
- $\mathcal{F}$ : family
- $\mathcal{A}$ : algebra

---

<sup>0.1</sup>Especially ' $\cap$ ' and ' $\cup$ ' are often mistaken because of typos.

## Lecture 1:

Lecturer: Brandon Alberts

Scribes: Rabbittac

**Definition 1.1 (Law of Composition)**

A **law of composition** on set  $S$  is a rule for combining two elements  $a, b \in S$  to create another element  $p \in S$

$$S \times S \rightarrow S$$

e.g.1.

- Addition on  $\mathbb{Z}, \mathbb{R}$ , etc
- Multiplication on  $\mathbb{Z}, \mathbb{R}$ , etc
- Cross product:  $v_1, v_2 \in \mathbb{R}^3 \rightarrow v_1 \times v_2 \in \mathbb{R}^3$
- Dot product is **NOT**:  $v_1, v_2 \in \mathbb{R}^3 \rightarrow v_1 \cdot v_2 \in \mathbb{R}$
- Division is **NOT**: division by 0 fails
- Composition of functions  $f \circ g : t \rightarrow f(g(t))$

**Definition 1.2 (Commutative)**

A law of composition is **commutative** if  $ab = ba$  <sup>1.1</sup>.

**Definition 1.3 (Associative)**

A law of composition is **associative** if  $(ab)c = a(bc)$ .

**Proposition 1.1**

For an associative law of composition on  $S$ , there is a unique way to define a product of  $n$  elements  $a_1, a_2, \dots, a_n$  temporarily denoted as  $[a_1, a_2, \dots, a_n]$ :

1.  $[a_1] = a_1$
2.  $[a_1, a_2] = a_1 a_2$
3.  $\forall 1 \leq i \leq n : [a_1, a_2, \dots, a_n] = [a_1, \dots, a_i][a_{i+1}, a_n]$

**Proof:** By induction,  $n = 1, 2$  are defined. Now suppose the proposition holds at  $r = n - 1$ , then  $[a_1, a_2, \dots, a_n] = [a_1, \dots, a_{n-1}][a_n] = ([a_1, \dots, a_i][a_{i+1}, a_{n-1}][a_n]) = [a_1, \dots, a_i]([a_{i+1}, \dots, a_{n-1}][a_n]) = [a_1, \dots, a_i][a_{i+1}, \dots, a_n]$ . ■

<sup>1.1</sup>We commonly use  $ab$  to denote laws of composition.  $a + b$  is only used for commutative laws in this course.

**Definition 1.4 (*Identity*)**

An **identity** of a law of composition is an element  $e \in S$  satisfying  $\forall a \in S : ea = a = ae$  <sup>1.2</sup>.

A law of composition can have at most one identity.

**Definition 1.5 (*Invertible*)**

Suppose a law of composition on  $S$  has an identity 1. An element  $a \in S$  is **invertible** if  $\exists b \in S : ab = 1 = ba$  <sup>1.3</sup>.

**Proposition 1.2**

1. If  $a$  has both left inverse  $la = 1$  and a right inverse  $ar = 1$ , then  $l = r = a^{-1}$ .
2. Inverses are unique.
3.  $(ab)^{-1} = b^{-1}a^{-1}$

Exercise: Let  $T = \{a, b\}, S = \{f : T \rightarrow T\}$ . Fill the table i tau alpha beta

<sup>1.2</sup>Identities are denoted 1 if compositions are written multiplicatively; 0 if compositions are written additively.

<sup>1.3</sup>If so, we call  $b$  the inverse of  $a$  and write  $b = a^{-1}$ , or  $-a$  for addition notation.
